1. Project Overview

PocketSmart AI is a web-based smart budget planning application designed to help users organize spending for selected everyday requirements. The project presents a clean website interface with a home section, planner cards, a budget calculation section and user testimonials.

The project title displayed in the webpage is “PocketSmart AI”, and the main description presents it as AI-powered budget planning for everyday needs. The interface allows the user to enter a budget, select a planner and choose a spending priority before generating a budget recommendation.

Main Objective

The objective of the implemented application is to provide a simple way to organize a given budget into main spending, secondary expenses, an emergency buffer and savings.

Project Scope in the Current Code

- Home Interior Budget Planner
- Party Budget Planner
- Jewelry Budget Planner
- Budget input in Indian Rupees (₹)
- Balanced, Save More and Premium priorities
- Automatic recommendation display
- Responsive mobile layout

2. Technologies Used

HTML

HTML is used to create the structure of the webpage, including the navigation bar, hero section, planner cards, budget form, recommendation area, testimonials and footer.

CSS

CSS is used for the visual design. The project defines colors, spacing, typography, cards, buttons, sections, shadows, responsive behavior and mobile layout. The main page uses a blue-themed interface with white content cards.

JavaScript

JavaScript provides the interactive functionality. It handles planner selection and the budget calculation. The functions implemented in the project are `selectPlanner()` and `calculateBudget()`.

Technology Summary

Technology	Role in the Project
HTML	Webpage structure and content
CSS	Design, layout and responsive styling
JavaScript	Planner selection and budget calculation

3. Main Features

HomeInteriorBudgetPlanner

This planner is intended for homeinteriorbudgeting. The displayed description mentions furniture, paint, lighting anddecor as themain items.

Party Budget Planner

Thisplannerhelpsorganizeaparty budget. The displayed categories are venue, food, decoration and entertainment.

Jewelry Budget Planner

Thisplanner organizesajewelrybudget. The displayed categories include jewelry purchase, making chargesand accessories.

Priority Selection

Theuser can selectone ofthree priorities: Balanced, Save More or Premium. The selected priority changes the percentage allocationused by the JavaScript calculation.

Recommendation Output

Aftercalculation,the resultsection displays the selected planner, recommended main spending, secondaryexpenses, emergency buffer, savings and a short description of the planner category.

Responsive Design

TheCSS containsamobilemedia query. On smaller screens, navigation links are hidden, cards become a single-column layout, sections receive smaller padding and the buttons are arranged vertically.

4. System Working Flow

The current application follows this sequence:

1. Open the PocketSmart AI webpage.
2. Select a planner from the available planner cards or from the Smart Budget Planner section.
3. Enter the available budget in Indian Rupees.
4. Select a priority: Balanced, Save More or Premium.
5. Click “Generate Smart Plan”.
6. JavaScript checks whether the entered budget is valid.
7. The selected priority determines the percentage allocation.
8. The selected planner determines the descriptive category text.
9. The recommendation section becomes visible and displays the calculated values.

Planner Selection Function

The `selectPlanner(name)` function changes the planner selection and smoothly scrolls the page to the budget planner section. This connects the planner cards with the calculation form.

Budget Calculation Function

The `calculateBudget()` function reads the budget, planner type and priority from the form. If the budget is missing or not positive, the application shows a validation alert. Otherwise, it calculates the four budget components and displays the result.

5. Budget Recommendation Logic

The current implementation uses fixed percentage rules in JavaScript. The

percentages are applied to the budget entered by the
Balanced

Category	Percentage
Main spending	55%
Secondary expenses	25%
Emergency buffer	10%
Savings	10%

Save More

Category	Percentage
Main spending	50%
Secondary expenses	25%
Emergency buffer	10%
Savings	15%

Premium

Category	Percentage
Main spending Secondary	65%
expenses Emergency	25%
buffer	5%
Savings	5%

These percentages are the rules actually implemented in the uploaded JavaScript code. The current code does not show a machine-learning model or external AI service; the recommendations are generated using these predefined percentage rules.

6. Project Summary for Presentation

PocketSmart AI is a smart budget planning web application developed using HTML, CSS and JavaScript. It helps users organize their available budget for different requirements such as home interior, parties and jewelry. Users enter their budget, select a planner and choose a spending priority. The JavaScript logic then calculates the recommended main spending, secondary expenses, emergency buffer and savings. The project also provides a responsive interface for smaller screens.”

Key Points for Viva/Seminar

- The project is a web-based budget planning application.
- The frontend is built with HTML and CSS.
- JavaScript provides the interactive budget calculation.
- Three planner categories are available.
- Three spending priorities are available.
- The output includes spending, emergency buffer and savings.
- Invalid or non-positive budgets are rejected with an alert.
- The page includes responsive mobile styling.

Conclusion

PocketSmart AI provides a simple interface for organizing a user-defined budget. Its current implementation combines a responsive webpage with predefined JavaScript budget-allocation rules to generate an immediate spending recommendation.
